Incident Response Report: LockBit Ransomware Memory Analysis

Executive Summary

A memory dump (Lockbit.vmem) was provided for a compromised Windows machine suspected of a ransomware infection. Utilizing the Volatility Framework for memory forensics alongside Open-Source Intelligence (OSINT) and Sandbox platforms (VirusTotal, Hybrid-Analysis), the malicious activity was successfully triaged. The investigation confirmed a **LockBit Ransomware** infection, identifying the precise time of execution, the malicious payload, persistence mechanisms, and associated Indicators of Compromise (IoCs).

Tools & Utilities

- **Memory Forensics:** Volatility Framework 2.6.1
- **Command Line Utilities:** grep, sha256sum
- **Threat Intelligence / Sandbox:** VirusTotal, Hybrid-Analysis

---

Investigation Methodology & Triage Steps

Phase 1: Environment Profiling and Timeline Construction

To begin the memory analysis, the correct operating system profile needed to be identified to ensure Volatility parses the memory structures accurately.

1. **Image Identification:** Executed the imageinfo plugin to determine the suggested profile.

Bash

vol.py -f Lockbit.vmem imageinfo

Result: The suggested profile was identified as **Win7SP1x64**.

2. **Identifying the Infection Time & Malicious Process:** By listing the running processes using process enumeration plugins (such as pslist), a highly suspicious executable named mal.exe was discovered running under PID **900**. The process creation timestamp revealed the exact moment the malware was executed: *Result:* **2023-04-13 10:06:45 UTC**

Phase 2: Payload Extraction and Hashing

To analyze the malware without detonating it, the binary was extracted directly from the memory dump.

1. **Command Line Argument Verification:** Verified the execution path of the suspicious process using the cmdline plugin.

Bash

vol.py -f Lockbit.vmem --profile=Win7SP1x64 cmdline | grep "mal"

Result: The malware was executed from "C:\Users\Josh\Desktop\mal.exe".

2. **Process Dumping:** Dumped the memory space of PID 900 to an executable file for static analysis.

Bash

vol.py -f Lockbit.vmem --profile=Win7SP1x64 procdump -p 900 -D .

Result: Successfully extracted executable.900.exe.

3. **Cryptographic Hashing:** Calculated the SHA-256 hash of the extracted payload to query threat intelligence databases.

Bash

sha256sum executable.900.exe

Result: 19ca5aa4cd62929afb255d2b38e70fd3143e3b181889e84348a5c896e577d708

Phase 3: Threat Intelligence and Behavioral Analysis

The extracted SHA-256 hash was analyzed using VirusTotal and Hybrid-Analysis to understand the malware's behavior, family, and capabilities.

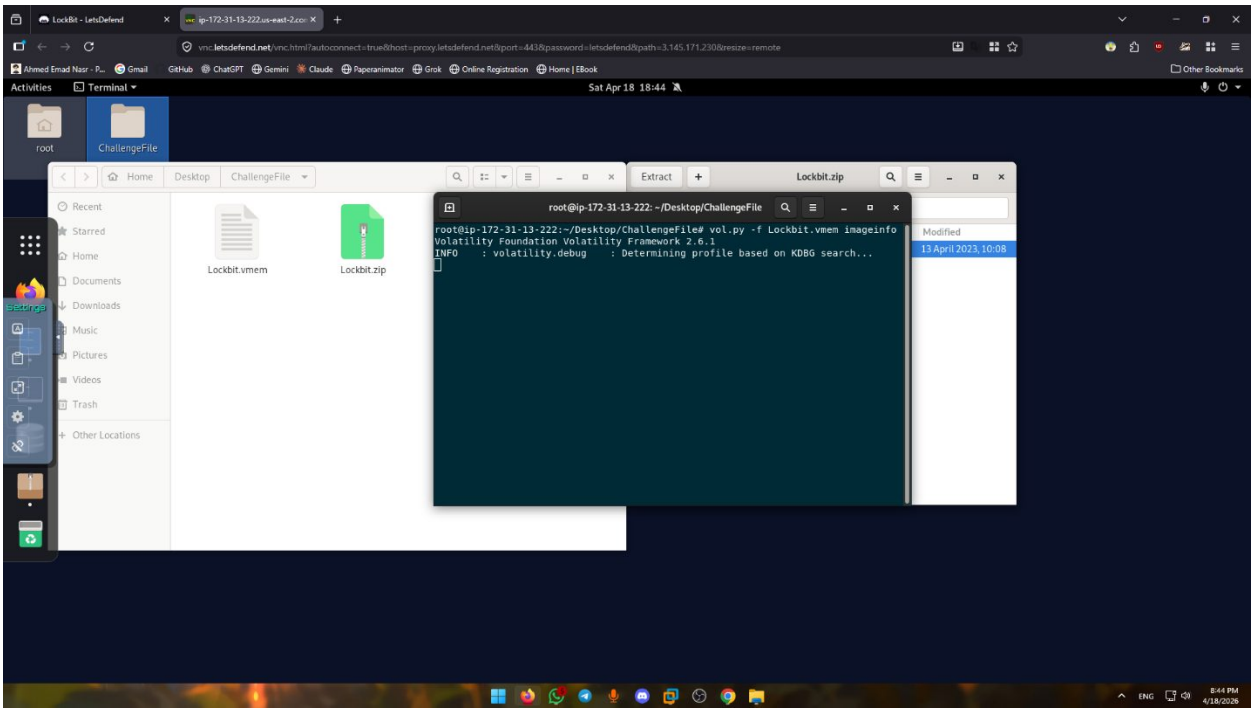

1. **Malware Family Identification:** VirusTotal flagged the file with 61/71 detections, categorizing it under the **LockBit** ransomware family.
2. **File System Actions & Extensions:** Reviewing the behavioral tab on VirusTotal showed the files accessed and modified by the process. The malware appended the **.lockbit** extension to encrypted files (e.g., 7-Zip.chm.lockbit).
3. **Advanced Hashing (TLSH):** The Details tab on VirusTotal provided the Trend Micro Locality Sensitive Hash (TLSH), a fuzzy matching hash used to identify similar malware variants: *Result:* T119E3163DB459E165C8CF04B57E2516BAD671F83C037989F3EBD38C299420EE86626B07

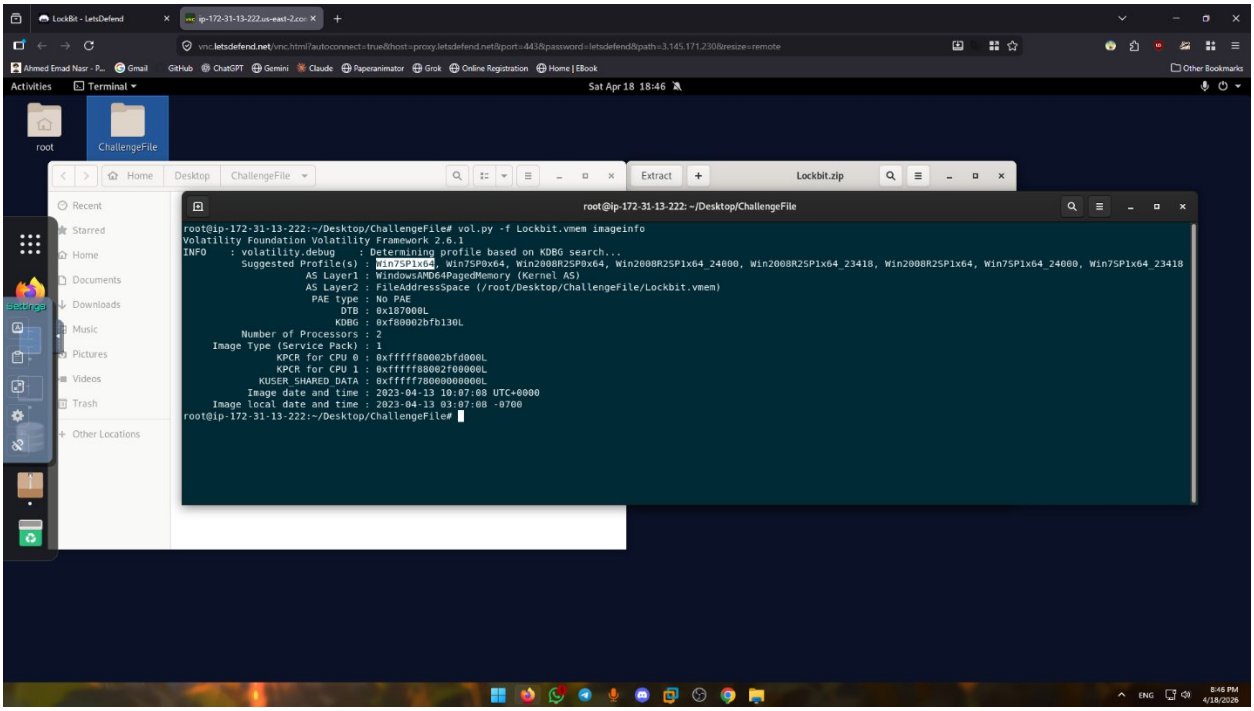

4. **Tactics, Techniques, and Procedures (TTPs):** The MITRE ATT&CK section in the dynamic analysis sandbox confirmed that the ransomware utilized technique **T1543** (Create or Modify System Process) to perform Privilege Escalation.
5. **Ransom Note Identification:** Behavioral analysis revealed that the ransomware dropped a ransom note to instruct the victim. The SHA-256 hash of this dropped text file was identified as: *Result:* 67c6784a5296658ac4d633f4e8c0914ecc783b1cf2f6431818c4e2f3cdcce91f
6. **Persistence Mechanism:** Analyzing the "Registry Keys Set" behavior in VirusTotal demonstrated how the malware maintained access across reboots. It added a value to the HKCU\...\CurrentVersion\Run registry hive. *Result:* The specific registry key edited was **XO1XADpO01**.

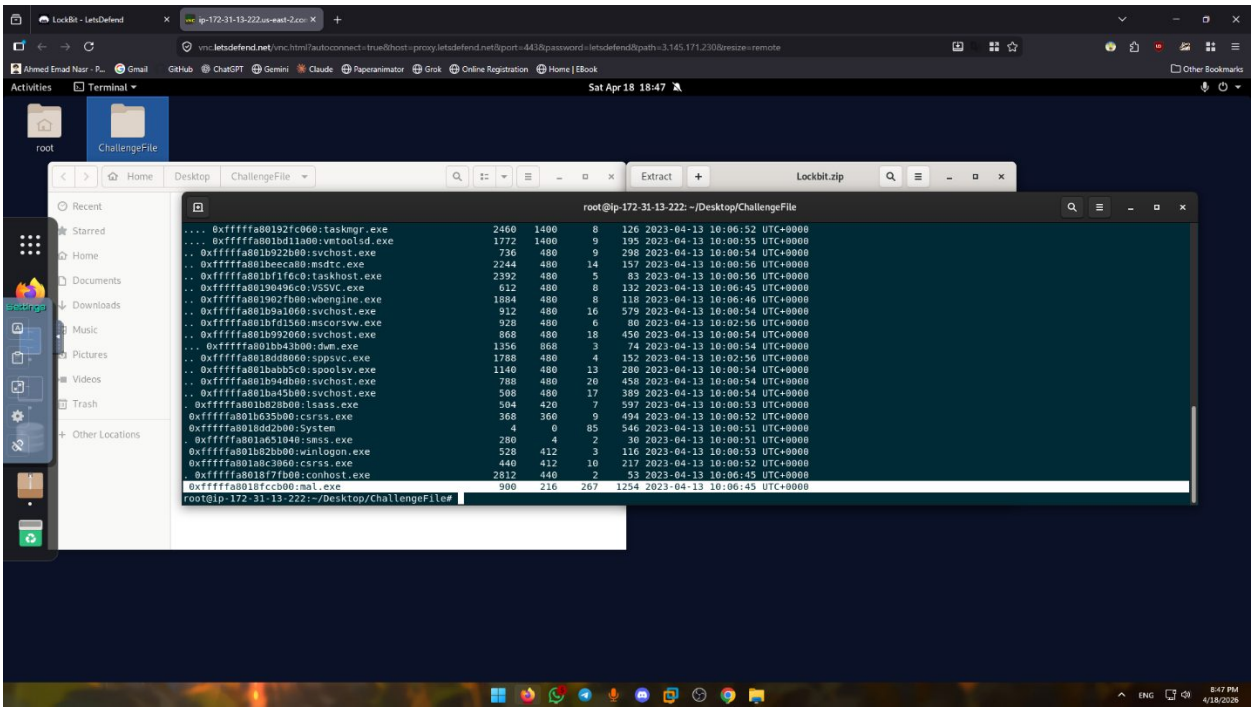

Challenge Solutions (Q&A)

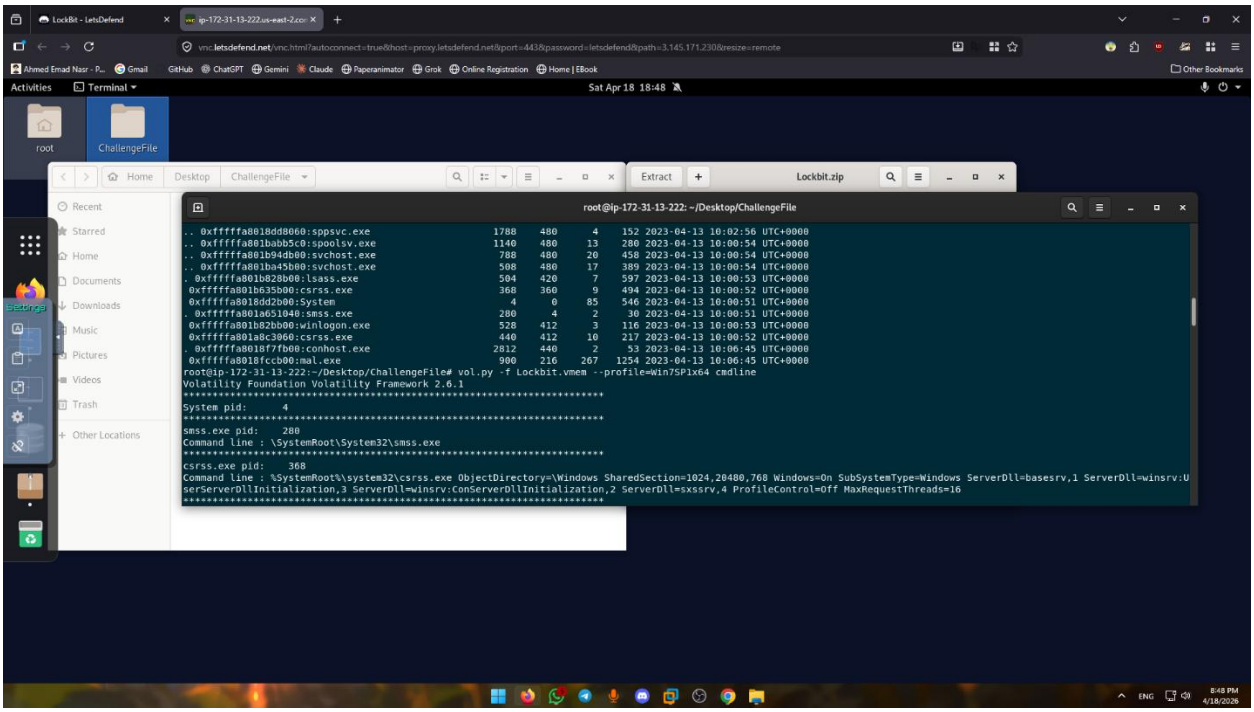

- **Q: Can you determine the date and time that the device was infected with the malware? (UTC, format: YYYY-MM-DD hh:mm:ss)**
    - **A:** 2023-04-13 10:06:45
- **Q: What is the name of the ransomware family responsible for the attack?**
    - **A:** lockbit
- **Q: What file extension is appended to the encrypted files by the ransomware?**
    - **A:** .lockbit
- **Q: What is the TLSH (Trend Micro Locality Sensitive Hash) of the ransomware?**
    - **A:** T119E3163DB459E165C8CF04B57E2516BAD671F83C037989F3EBD38C299420EE86626B07
- **Q: Which MITRE ATT&CK technique ID was used by the ransomware to perform privilege escalation?**
    - **A:** T1543
- **Q: What is the SHA256 hash of the ransom note dropped by the malware?**
    - **A:** 67c6784a5296658ac4d633f4e8c0914ecc783b1cf2f6431818c4e2f3cdcce91f

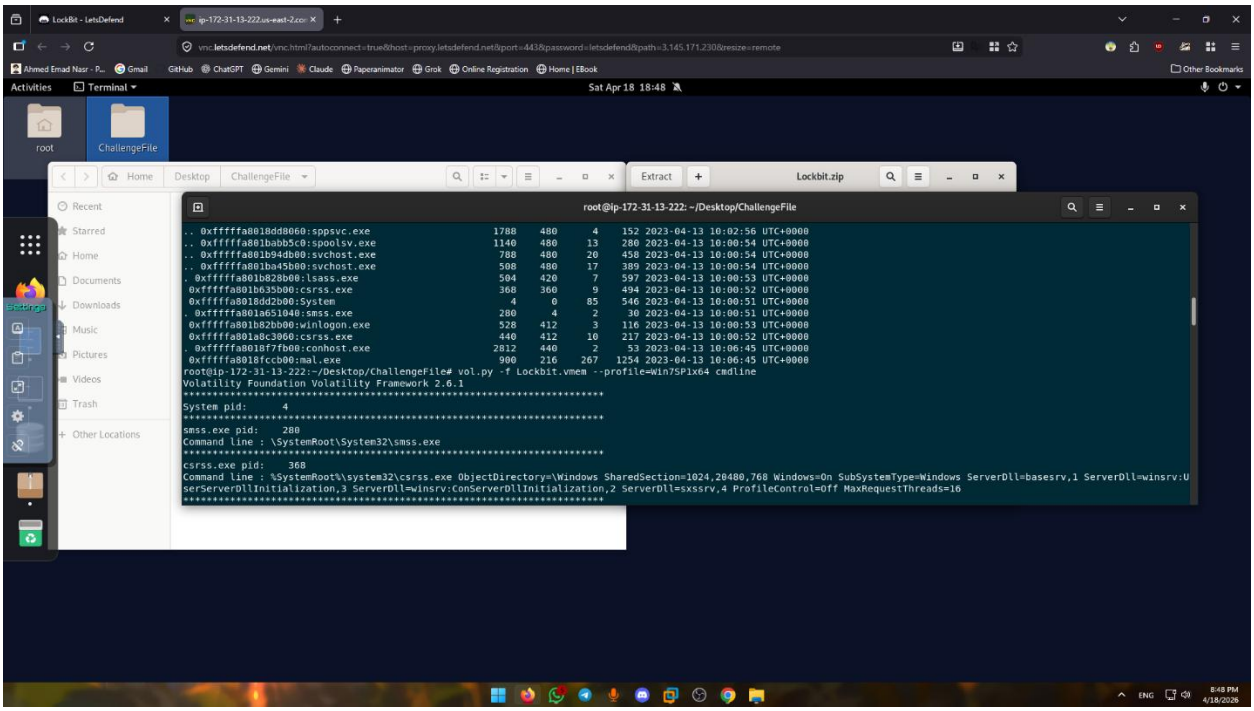

- **Q: What is the name of the registry key edited by the ransomware during the attack to apply persistence on the infected system?**
    - **A:** XO1XADpO01

عايز اجيب الهاش بتاع ال مالوير ده
عندك الـ PID بتاع الملف (900) وعرفت الـ command line. الخطوة الجاية إنك تطلع الملف نفسه من الميموري وبعدين تحسب له الـ hash.
1) استخراج الملف من الميموري
استخدم procdump في Volatility:
Bash
vol.py -f Lockbit.vmem --profile=Win7SP1x64 procdump -p 900 -D .
ده هيطلعلك ملف زي:
executable.900.exe
2) حساب الـ hash
على Linux:
Bash
md5sum executable.900.exe
Ask anything
ChatGPT can make mistakes. Check important info.
